Description of Fall/Winter Services

Deep Root Fertilizer: An organic deep root liquid fertilization designed specifically for the fall season. The blend of bio-stimulants, such as kelp, humates and beneficial microbes, along with a well-rounded fertilizer, will stimulate and promote root growth. This will help to ensure the absorption of the nutrients needed to maintain the health and beauty of your trees throughout the growing season.

Anti-desiccant Spray: This creates a barrier to help reduce the effects of severe cold temperatures and wind throughout the winter months. It is recommended for all broadleaf evergreens such as boxwoods, rhododendrons and azaleas. This protection is most effective when applied twice during the winter season. If you are interested in this protection and do not have this application on your proposal, please contact our office.

Deer Repellant Spray: This spray is normally applied twice during the season to help deter deer from feasting on your valuable trees and shrubs. Some of your properties have heavy deer traffic and may require a third deer repellant application. One of our arborists will determine if a third application is necessary. The product we use in order to provide the best protections against deer damage, will leave a slight white residue on the leaves. We know many of you would prefer a “clear coat” application, but we have found that those products do not offer the same degree of protection. We hope you agree that white residue is a small price to pay for the protection of your beautiful and valuable shrubs.
